

```

#include <iostream>

using namespace std;

int newvalue(){
    char ch= 'y';
    cout<<"\n do you want enter new value (y/n) ? ";
    cin>>ch;
    return (ch == 'y' || ch == 'Y') ? 1:0;
}

void input(int* &arr,int &sz){
    // Allocate new memory for the growing array
    int *newArr = new int[sz + 1];

    // Copy existing elements to the new array
    for (int i = 0; i < sz; i++) {
        newArr[i] = arr[i];
    }

    // Add the new input to the array
    cout<<"\n new value = ";
    cin>>newArr[sz];

    // Free the old memory
    delete[] arr;

    // Update the pointer and size
    arr = newArr;

    sz++;
}

int main() {
    int *arr = nullptr; // Pointer to store the dynamically allocated array
    int sz = 0;         // Current size of the array

```

```
while (newvalue()) {  
    input(arr,sz);  
}  
// Display the stored values  
cout << "\n values stored in your dynamic array = ";  
for (int i = 0; i < sz; i++) {  
    cout << arr[i] << "    ";  
}  
cout << endl;  
// Free the final allocated memory  
delete[] arr;  
return 0;  
}
```
